#### **CONTENT**

- 1. Methodology
- 2. Consider the driving effects of planning transport infrastructure on LUCC
- 3. Consider the driving effects of development zone on LUCC

Note that these functions are only integrated into PLUS v1.3.5 and later versions. Please learn tutorial A before reading this tutorial. The planning data in this tutorial is the dummy data for the model test. Please don't regard them as the real planning data.

01

Methodology

# Method and thought

We used an updated mechanism of planning transport infrastructure based on random forest (RF) and a random seeding mechanism based on planning development zone, which can consider the driving effects of planning policies or future variables on LUCC into the simulation.

This study only considers planning policies in space, not macro-scale policies, including 1) planning traffic lines or sites and 2) planning development zone. Moreover, predicted variables exported by other models can also be imported to the PLUS model in the same way, for example, the future population, GDP, temperature, precipitation, etc.

Systems, 85:101569

#### The updated mechanism

#### **Flowchart**

- First, sampled land-use map data and historical driving force data are employed to train the RF.
- The driving factors that will be updated are specified in this step (only driving factors with both historical and planning schemes (or future variables) can be updated).
- In the RF prediction process, the historical driving forces in the specified layers are replaced with data that include both historical and future driving forces and output the development probabilities.

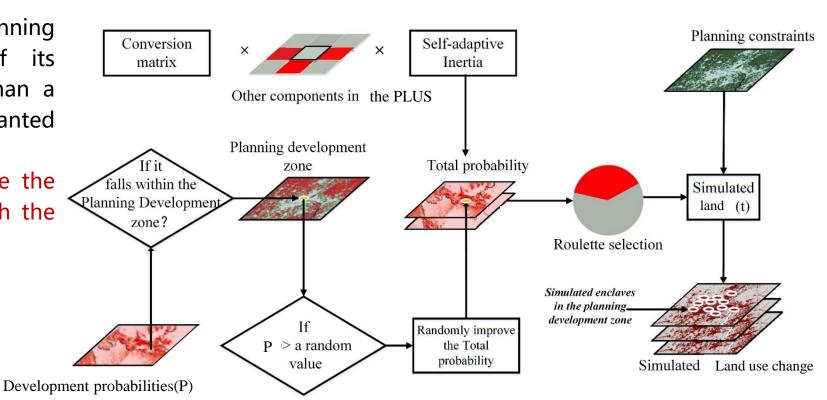

### The random seeding mechanism

#### Flow chart

- A cell that is located in the planning development zones is selected. If its development probability is greater than a random value within [0, 1], a seed is planted in the cell.
- A planted seed will randomly increase the total probability of an urban area with the following rule:

$$TP_k = \begin{cases} (r + TP_k) \times w & if \ r + TP_k \le 1\\ 1 \times w & if \ r + TP_k > 1 \end{cases}$$

 $TP_{m{k}}$  - denotes the total probability of specific land k

- r a random value within [0, 1]
- w the weight of the strength of planning development zones

✓ Click the "Start" button and wait for the output files.

✓ Output two groups of development probabilities:

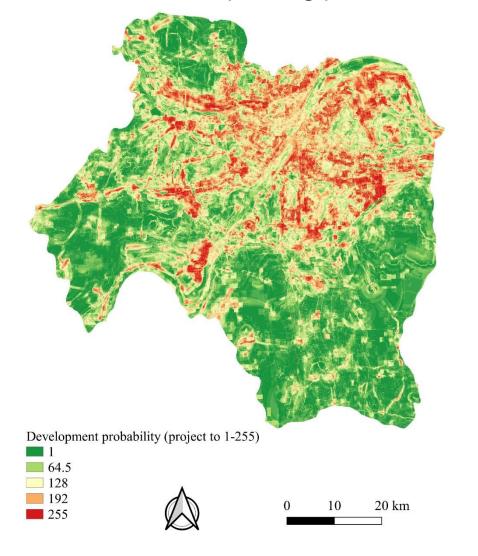

**devprob\_Update\_band1-7.tif:** development probabilities under the influences of planning policies, which is the input of the next step.

**devprob\_band1-7.tif:** development probabilities without the influences of planning policies, which is used to compare with the one with the influences of planning policies.

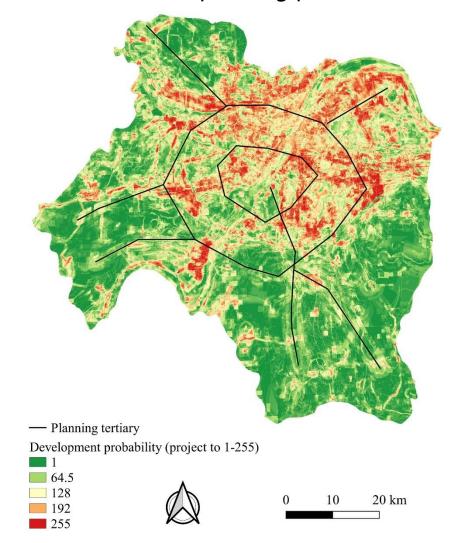

## **Output results**

Urban development potential without the influences of planning policies

Urban development potential under the influences of planning policies

# Consider the driving effects of development zones on LUCC

#### Add in the planning development zones

■ CARS		- 🗆 X
I	Neighborhood Size 3 🕏	Thread 1 🕏
	Data Preparation  Land use pattern	
	Development potential	
	Conversion constraint	☐ Devlopment Zone
	Output Path	
	Patch generation threshold 0.5 Expansion coefficient 0.1	Percentage of seeds 0.0001
	Color Dynamic Display	Parameter Stop Run

	Development type	0	Der	/lopment Zone
	Development weight	0.5		
7				
ent	0.1	Percentage of seeds	0.0001	

- Click the "Development Zone" checkbox to active the "Development type" and "Development weight" parameters
- "Development Zone" is used to defining the land use type that is influenced by the planning policies; "Development weight" ranges from 0-1, which is used to defining the strength of the planning policies.

#### Make the planning development zones

Make the "conversion constraints area and planning development zones", the value of conversion constraints area is 0, and the value of planning development zone is 2. Value 1 means transitions are allowed.

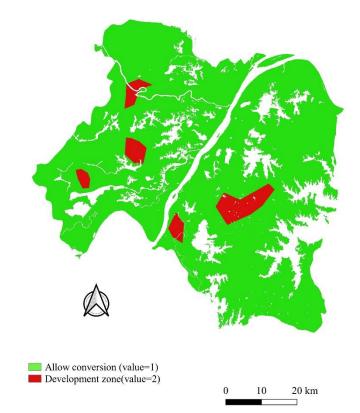

Open water/coversion restrict area (value=0) Allow conversion (value=1) Development zone(value=2)

Import this file to the conversion tools of the PLUS model to convert it to 'unsigned char' format.

Convert LULCs Data to Unsigned Char Format Original LULCs 1 C:/Users/HP/Downloads/PLUS/PLUS\_test\_data/dummyDevelopmentZone\_water.tif Finish! Output Folder OK C:/Users/HP/Downloads/PLUS/PLUS test data/ — Please wait — Output path: C:/Vsers/HP/Downloads/PLUS/PLUS\_test\_data/dummyDevelopmentZone\_water\_uc.tif Convert

The value 0 will be converted to nodata value in this tool and will not be shown in the final results.
